Assignment 2 10.15.2.4

K.SaiTeja AI22BTECH11014

Question: 2) A box contains 12 balls, out of which x are black. If one ball is drawn at random from the box, what is the probability that it will be a black ball?

If 6 more black balls are put in the box, the probability of drawing a black ball is now double of what it was before. Find x.

Solution:

Let the event black balls be denoted by B

Total number of black balls = x
Total number of balls = 12
The probability of getting a black ball is given by:

$$\Pr\left(\mathbf{B}\right) = \frac{x}{12} \tag{1}$$

2) After adding 6 more black balls, the total number of balls becomes = 18 Now the total number of black balls becomes = x + 6.

The probability of getting a black ball now is given by:

$$\Pr\left(\mathbf{B}\right) = \frac{x+6}{18} \tag{2}$$

It is given that the probability of drawing a black ball now is double of what it was before. So we have:

$$\frac{x+6}{18} = 2 \times \frac{x}{12} \tag{3}$$

Solving the equation, we get:

$$x + 6 = 3x \tag{4}$$

$$2x = 6 \tag{5}$$

$$x = 3 \tag{6}$$

 \therefore The value of x = 3.
